Certainly! Here's a rewritten documentation for the `epd2in13_V4.py` module, focusing on clarity and ease of understanding:

Electronic Paper Display (EPD) Driver for 2.13 Inch Version 4

This Python module provides a driver for controlling electronic paper displays (EPD) of 2.13-inch size, version 4. It allows users to initialize the display, draw on it, and perform various display operations.

Usage Example:

python Copy code

```python
# Import the module
from waveshare_epd import epd2in13_V4

# Initialize the display
epd = epd2in13_V4.EPD()
epd.init()

# Clear the display
epd.Clear(0xFF)

# Drawing on the image
image = Image.new('1', (epd.height, epd.width), 255)
draw = ImageDraw.Draw(image)
# Draw various shapes, text, etc.
# Display the image
epd.display(epd.getbuffer(image))
```

Methods:

1. `__init__(self)`: Initializes the EPD object.
2. `reset(self)`: Performs a hardware reset of the EPD.
3. `send_command(self, command)`: Sends a command to the EPD.
4. `send_data(self, data)`: Sends data to the EPD.
5. `send_data2(self, data)`: Sends a large amount of data to the EPD.
6. `ReadBusy(self)`: Waits until the EPD is not busy.
7. `TurnOnDisplay(self)`: Turns on the EPD display.
8. `TurnOnDisplay_Fast(self)`: Turns on the EPD display fast.
9. `TurnOnDisplayPart(self)`: Turns on a part of the EPD display.
10. `SetWindow(self, x_start, y_start, x_end, y_end)`: Sets the display window.
11. `SetCursor(self, x, y)`: Sets the cursor position.
12. `init(self)`: Initializes the EPD hardware and registers.
13. `init_fast(self)`: Initializes the EPD hardware and registers fast.
14. `getbuffer(self, image)`: Converts an image to a buffer compatible with the EPD.
15. `display(self, image)`: Displays an image on the EPD.
16. `display_fast(self, image)`: Displays an image on the EPD fast.
17. `displayPartial(self, image)`: Performs a partial refresh of the EPD display.
18. `displayPartBaseImage(self, image)`: Refreshes a base image on the EPD display.
19. `Clear(self, color=0xFF)`: Clears the EPD display with a specified color.
20. `sleep(self)`: Enters sleep mode to save power.

Constants:

- `EPD_WIDTH`: Width of the EPD display.
- `EPD_HEIGHT`: Height of the EPD display.

Dependencies:

- This module depends on the `epdconfig` module, which provides hardware

configuration and interaction with the EPD.

- It also requires the `PIL` (Python Imaging Library) module for image manipulation.

Hardware Setup:

- Ensure proper wiring of the EPD to the microcontroller.
- Provide the necessary SPI and GPIO connections as per the hardware configuration.

Notes:

- This module provides a simple interface for controlling EPD displays.
- Users can draw shapes, text, and images on the display using the `PIL` library.
- Make sure to follow the example code provided for correct usage.

This documentation aims to provide a clear understanding of the functionalities offered by the `epd2in13_V4.py` module and how to use them effectively.
